

a The climate variable is referenced to each species' own range

Same province, same year, opposite sign for two species

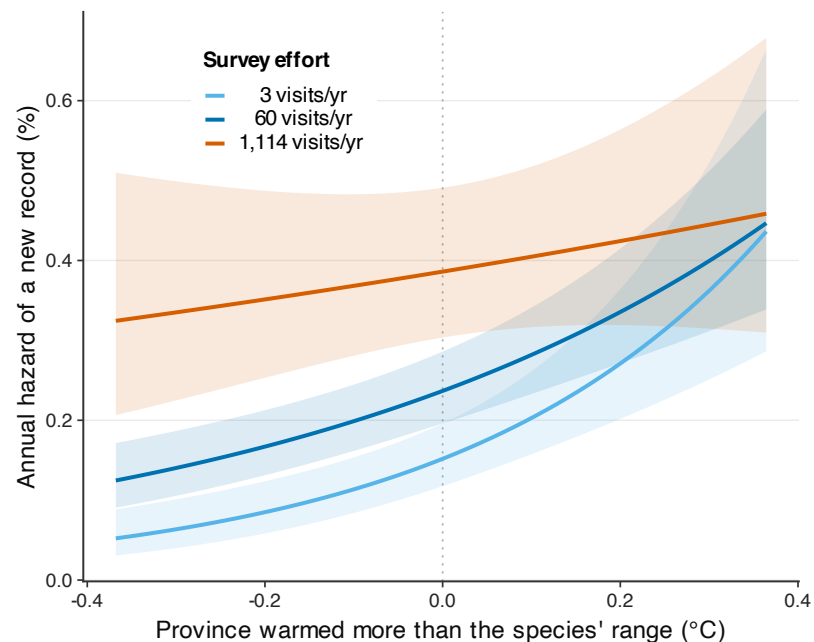

b Species identity carries much of the signal

A purely regional variable would have no green band

c Effect sizes in units a reader can picture

One SD of accumulated warming is 0.18°C ; one SD of effort multiplies annual visits by 7.7

d

The observation process outweighs either driver

One SD of province-by-year shock multiplies the hazard by 2.23, more than warming or effort
